

Specialist Working Group for Haematology

Proposed changes to the *Criteria for the clinical use of intravenous immunoglobulin in Australia, Second Edition*

ITEM	CRITERIA FOR THE CLINICAL USE OF INTRAVENOUS IMMUNOGLOBULIN IN AUSTRALIA, SECOND EDITION (CRITERIA)	PROPOSED REVISIONS TO THE CRITERIA	SWG RATIONALE FOR PROPOSED CHANGE (A) Administrative) (B) Progressive (C) Programmed
Condition Name	Neonatal haemochromatosis (NH)	Neonatal haemochromatosis (NH)	
Specialty	Haematology	Haematology	
Chapter	5	5	
Specific Conditions			
Level of Evidence	Evidence of probable benefit (Category 2a).	Evidence of probable benefit (Category 2a).	
Justification for Evidence Category	A trial compared the impact of IVIg on pregnancy outcome of women whose most recent pregnancy had resulted in NH with historical controls (randomly selected previously affected pregnancies). All 15 pregnancies resulted in live births. NH was diagnosed in 11 but responded to medical treatment. By contrast, there were 2 successful outcomes in controls (Biotext 2004).	A trial compared the impact of intravenous immunoglobulin (IVIg) on pregnancy outcome of women whose most recent pregnancy had resulted in NH with historical controls (randomly selected previously affected pregnancies). All 15 pregnancies resulted in live births. NH was diagnosed in 11 but responded to medical treatment. By contrast, there were two successful outcomes in controls (Biotext 2004). Rand et al (2009) describes successful treatment of NH in neonates using exchange transfusion and IVIg.	Addition of evidence with successful use of IVIg together with exchange transfusion. (A)

ITEM	CRITERIA FOR THE CLINICAL USE OF INTRAVENOUS IMMUNOGLOBULIN IN AUSTRALIA, SECOND EDITION (CRITERIA)	PROPOSED REVISIONS TO THE CRITERIA	SWG RATIONALE FOR PROPOSED CHANGE (A) Administrative) (B) Progressive (C) Programmed
Description and Diagnostic Criteria	<p>NH manifests in the foetus and newborn and is characterised by abnormal accumulation of iron in the liver and extra-hepatic tissues. Affected neonates present with fulminant liver failure, usually in the context of a history of prematurity, intrauterine growth retardation and oligohydramnios. NH differs from most other causes of neonatal liver disease, other than congenital infections, in that the condition begins in utero and fulminant liver disease is manifested in the first few days of life. The aetiology and pathogenesis remains uncertain. The NH phenotype may be the outcome of numerous disease processes. There is also evidence, however, that NH is an alloimmune disorder. First, there is an approximate 80% likelihood of NH once a woman has an affected baby. Second, mothers can have affected babies with different fathers. It has not been described that fathers can have affected half-siblings with different mothers.</p> <p>Symptoms and signs</p> <p>Affected neonates present with signs of liver failure, including extreme cholestasis,</p>	<p>NH manifests in the foetus and newborn, and is characterised by abnormal accumulation of iron in the liver and extra-hepatic tissues. Diagnosis is required		No	Which Speciality		
Diagnosis must be verified		No	Which Speciality		

ITEM	CRITERIA FOR THE CLINICAL USE OF INTRAVENOUS IMMUNOGLOBULIN IN AUSTRALIA, SECOND EDITION (CRITERIA)	PROPOSED REVISIONS TO THE CRITERIA	SWG RATIONALE FOR PROPOSED CHANGE (A) Administrative) (B) Progressive (C) Programmed
Exclusion Criteria			
Indication for use	Pregnant women who have had a previous pregnancy affected by neonatal haemochromatosis.	Pregnant women who have had a previous pregnancy affected by neonatal haemochromatosis. Neonate with neonatal haemochromatosis.	Addition of indication of treatment in neonate with IVIg and exchange transfusion. (A)
Qualifying Criteria	Women who are pregnant or attempting to conceive and their most recent pregnancy ended in delivery of a foetus shown to have had NH.	Pregnant women who have had a previous pregnancy affected by NH. Pregnant woman or woman attempting to conceive with a previous pregnancy ending in delivery of a fetus shown to have had NH. Neonate with NH. A diagnosis of NH confirmed in a neonate by exclusion of other causes of neonatal liver failure and findings of high ferritin in liver biopsy, and MRI demonstration of iron overload.	Qualifying Criteria aligned with current criteria however, SWG recommends wording in the current version is too restrictive to limit to the 'most recent' pregnancy (Qualifying criteria) and the wording of the original indication should be used (previous pregnancy). (A) Qualifying criteria and evidence items defined to confirm Neonatal NH diagnosis. (A)
Review Criteria	<ul style="list-style-type: none"> Occurrence of NH, or evidence of liver disease (serum ferritin and a-fetoprotein levels, coagulopathy) in the offspring of women who have previously given birth to an NH-affected neonate. Requirement for liver transplantation in 	Pregnant women who have had a previous pregnancy affected by NH. Review Is Required No Continuing Treatment is permitted No Continuing authorisation request is required N/A Maximum Authorised Treatment Period	While the maximum term would be 42 weeks for a normal pregnancy, these pregnancies are likely to be induced earlier. SWG confirmed that the maximum time of 5 months treatment (i.e. treat from 18 until 38 weeks pregnant) was sufficient. (A)

ITEM	CRITERIA FOR THE CLINICAL USE OF INTRAVENOUS IMMUNOGLOBULIN IN AUSTRALIA, SECOND EDITION (CRITERIA)	PROPOSED REVISIONS TO THE CRITERIA	SWG RATIONALE FOR PROPOSED CHANGE (A) Administrative) (B) Progressive (C) Programmed
	<p>these neonates.</p> <ul style="list-style-type: none"> Survival and development of infants following maternal IVIg therapy during pregnancy. 	<p>(Initial) 5 months Maximum Authorised Treatment Period (Continuing Reqs) N/A Who must undertake review Treating Specialist If review NOT required maximum length of authorisation 5 months Consider cessation Yes Consider Cessation Timeframe 5 months</p> <p>Review criteria for assessing the effectiveness of IVIg use:</p> <p>The occurrence of NH, or evidence of liver disease in the offspring of women who have previously given birth to an NH-affected neonate.</p> <ul style="list-style-type: none"> – Pregnancy resulted in live birth. – Evidence of liver disease in the neonate. – Requirement for liver transplantation in the neonate. <p>Neonate with NH.</p> <p>Review Is not required for this indication. Consider Cessation Timeframe 5 months</p> <p>Review criteria for assessing the effectiveness</p>	<p>Outcome data has been defined. (A)</p>

		<p>required.</p> <p>The aim should be to use the lowest dose possible that achieves the appropriate clinical outcome for each patient.</p> <p>Refer to the current product information sheet for further information.</p>	<p>Dosing for neonates consistent with literature. (B)</p>

POTENTIAL OPERATIONAL IMPACT			
It is unlikely that there will be any operational impact for this condition from transitioning to the revised Criteria. Where prescribers may have been unaware of the benefits of new evidence, improved clinical outcome might be expected.			
POTENTIAL IMPACT ON DEMAND			
2013-14 Patient Numbers	6 patients	Given the very low patient numbers, no impact is anticipated on demand.	
2013-14 Usage	<1% total use		
POTENTIAL IMPACT ON COST			
Current cost		Anticipated reduction in cost, if any Marginal = borderline or unchanged from current cost Minor = decrease by \$500K - \$1.99M from current cost Major = decrease \$2M+ from current cost	Marginal
